-:- SUBNIT: A double ring-shaped homohexamer of hslv is capped on each side by a ring-shaped hslv homohexamer (By similarity).
-:- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-:- SIMILARITY: Belongs to peptidase family T1B. Hslv subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sacteria; Proteobacteria; Gammaproteobacteria; Pseudomonadales;

                                            toward 3-hydroxybutyry1-CoA.
CATALYTIC ACTIVITY: (S)-3-hydroxyacy1-CoA + NAD(+) = 3-oxoacy1-CoA
                                                                                                                                                 and skeletal muscle.
J. Biol. Chem. 275:27186-27196 (2000).
-1- FUNCTION: Plays an essential role in the mitochondrial beta-oxidation of short chain fatty acids. Exerts it highest activity
                                                                                       -!- PATHWAY: Fatty acid beta-oxidation cycle, step 3.
-!- SUBUNIT: Homodimer.
-!- SUBCELLULAR LOCATION: Mitochondrial matrix.
-!- TISSUE SPECIFICITY: Expressed in liver, kidney, pancreas, heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genew; HGNC:4804; HADHSC.

Submitted (MAY-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Plays an essential role in the mitochondrial beta-
oxidation of short chain fatty acids. Exerts it highest activity
toward 3-bydroxybutyryl-CoA.
-!- CATALYTIC ACTIVITY: (S)-3-hydroxyacyl-CoA + NAD(+) = 3-oxoacyl-CoA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -1- PATHWAY: Fatty acid beta-oxidation cycle; step 3.
-1- SUBDAT: Homodimer (By similarity) ...
-1- SUBCELULAR LOCATION: Mitochondrial matrix.
-1- SIMILARITY: Belongs to the 3-hydroxyacyl-CoA dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Q614<u>7</u>5; Q925U9;

Biophys. Acta 1437:119-123(1999).

-!- FUNCTION: Plays an essential role in the mitochondrial beta-
oxidation of short chain fatty acids. Exerts it highest activity
toward 3-hydroxybutyryl-CoA.

-!- CATALYTIC ACTIVITY: ($)-3-hydroxyacyl-CoA + NAD(+) = 3-oxoacyl-CoA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1- SUBUNIT: Homodimer (By similarity).
1- SUBCELLULAR LOCATION: Mitochondrial matrix.
1- SIMILARITY: Belongs to the 3-hydroxyacyl-CoA dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                         30-WAY-2000 (Rel. 39, Created)

"Comparison of the NH2-terminal amino acid sequences of the four non-
identical subunits of the NAD-linked hydrogenases from Nocardia opaca
I hand Alcaligenes eutrophus H16,",

Eur. J. Biochem. 181:175-180(1989).

-!- CATALYIC ACTIVIT: H(2) + NAD(+) = H(+) + NADH.

-!- CORPATIVIT ACTIVIT: ACID and plan and a gamma subunits (flavin-
containing dimer), and a delta and a nickel-containing beta
subunits (hydrogenase dimer).

-!- SUBCILULAR LOCATION: Cytoplasmic.

-!- SUBCILULAR LOCATION: Cytoplasmic.

-!- SUMILARITY: Belongs to the [NiFe]/[NiFeSe] hydrogenase large
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to Mycobacterium tuberculosis (Mtb) vaccine candidate peptides. The invention also relates to a method for identifying Mtb vaccine candidate peptides as well as vaccines comprising these candidate peptides. Vaccines of the invention and Mtb vaccine candidate peptides are useful for inducing an anti- Mycobacterium tuberculosis (anti-Mtb) immune response by raising anti-Mtb antibody in a mammalian subject preferably human. They are used for immunising a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis. The present sequence is a Mtb vaccine candidate peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New vaccine for immunizing a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis.
                                                                                                                                             Mycobacterium tuberculosis, Mtb peptide; antibacterial; vaccine; infection; anti-Mtb immune response.
                                                                                                             Mycobacterium tuberculosis (Mtb) peptide #52.

The invention describes a method of inducing type 1/T-helper-1 T-cell response or interleukin-12 (IL-12) in a cell involves administration of a lipopeptide (I) having an N-terminal ester- or amide-linked fatty acyl group. The methods are used to stimulate cell-mediated immunity for prevention and treatment of pathogen infections (e.g. Mycobacterium tuberculosis) and for treatment of a interferon-gamma sensitive tumour. Also useful in the development of a interferon-gamma sensitive tumour. This is the amino acid sequence of mature Mycobacterium tuberculosis 38kDa protein from which lipopeptides can be isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inducing interleukin-12 and type 1/T-helper-1 T-cell response to stimulate cell-mediated immunity for preventing and treating pathogen infection involves administering lipopeptide having N-terminal ester- or amide-linked fatty acyl group.

The methods are used to stimulate cell-mediated immunity for prevention and treatment of pathogen infections (e.g. Mycobacterium tuberculosis) and for treatment of a interferon-gamma sensitive tumour. Also useful in the development of a interferon-gamma sensitive tumour. This is the amino acid sequence of Mycobacterium tuberculosis 38kDa protein from which lipopeptides can be isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         Inducing interleukin-12 and type 1/T-helper-1 T-cell response to stimulate cell-mediated immunity for preventing and treating pathogen infection involves administering lipopeptide having N-terminal esteramide-linked fatty acyl group.

- useful for the Peptide(s) from mycobacterium tuberculosis antigens diagnosis of tuberculosis.

Disclosure, Fig 1; 44pp; English.

The sequence is that of the 38 kDa lipoprotein antigen of Mycobacterium tuberculosis, from this peptides can be derived which can be used in place of the purified protein derivative (PPD) test. The peptides can be used to diagnose tuberculosis (TB) in a human or non-human animal, and to distinguish a TB patient from an infected or otherwise sensitised but healthy clinical suspect. They stimulate lymphocytes which have been sensitised to antigens of M. tuberculosis. The peptides may be used in in sensitised to antigens of M. tuberculosis. The peptides may be used in in vivo skin tests relying on delayed hypersensitivity reaction causing redefening and swelling, or in ex vivo detection of activated lymphocytes. They have excellent sensitivity and improved specificity to PPD-tuberculin. They fail to provoke a strong immune response in delayed-type tuberculin. They fail to provoke a strong immune response in delayed-type pulmonary and non-lymphatic extrapulmonary TB. This provides the basis of distinguishing TB patients from these patients. Diagnosing TB comprises either intradernal injection of the peptide, or contacting lymphocytes

Example 7; Page 165-166; 250pp; English.

This polypeptide comprises a fusion protein composed of Mycobacterium tuberculosis antigens TbRa3 (see AAW64295), 38 kDa antigen (see AAW64364) and TbS84 (see AAW64321). It was produced by PCR amplification (see AAW44407-12) of the appropriate antigen DNA sequences (see AAW44413) and cloning into an expression vector. The fusion protein was expressed in Ercalis to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, an immunogenic portion of a M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and encoding such polypeptides, recombinant expression vectors and diagnostic kits for detecting M. tuberculosis infection in a patient

This sequence represents a fusion protein containing the immunogenic polypeptides TDRa3, 38kD and TD38-1 from Mycobacterium tuberculosis (MT). This fusion protein can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of TB
                                                                                                                                                                                                                                                                                                             Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This polypeptide comprises Mycobacterium tuberculosis 38 kDa antigen. A This 3-38 kD-Tb39-1 fusion protein (see AAM6456) has been constructed that can be used in the serodiagnosis of tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. In provides polypeptides (see AAM64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, an immunogenic portion of an M. tuberculosis antigen, an immunogenic portion of an M. tuberculosis artigen, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a recombinant Mycobacterium tuberculosis triantigen fusion protein composed of the antigens TDRa3, 39kD and TD38-1. The fusion protein is expressed in host cells using a vector carrying a polymuclectide (see AA20196) comprising the 3 coding sequences for the antigens. The invention provides fusion proteins (see AA32059-71) and polymucleotides encoding them are useful as vaccines for proteins and polymucleotides encoding them are useful as vaccines for proteins tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring
                                                                                                                                 This sequence represents a 38kD antigen from Mycobacterium tuberculosis (MT). This antigen can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of TB
                                                           Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tuberculosis, antigen, fusion protein, TbRa3; 38KD, Tb38-1; diagnosis, therapy, vaccine; immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New fusion proteins useful for diagnosis, prevention and treatment of tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel recombinant antigens and their encoding mucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein components
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antiqen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by. T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. Adx19249 to AAZ19460 and AAX39083 to AAX39225 are used in the exemplification of

part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. M. wordines and fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAX39083 to AAX39225 are used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of polypeptide comprising CD8 T-cell epitopes derived from Mycobacterium tuberculosis proteins in the manufacture of a medicament for vaccinating prophylactically or therapeutically against mycobacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to use of polypeptides comprising CD8 T-cell epitopes derived from Mycobacterium tuberculosis proteins. The invention is useful in the manufacture of a medicament for prophylactic or therapeutic vaccination against mycobacterial infection. The polypeptide and the expression vector are capable of stimulating CD8 T-cell response. The invention also provides a vaccine composition which comprises polypeptide or expression vector useful for vaccinating a pre-selected host against a mycobacterial infection. The invention further relates to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   38kDa-LP protein, antibiotic, vaccine, CD8 T-cell, epitope, medicament, prophylactic, therapeutic, mycobacterial infection.
  New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.
                                                                                               present invention describes polypeptides comprising an immunogenic

ö
a method for determining the presence or absence of CD8 T-cell response to epitope sequence by identifying the presence or absence of T-cell that recognise the epitope sequence in a sample from the host. The present sequence is Mycobacterium tuberrulosis 38KDa-LP protein related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a recombinant nucleic acid molecule encoding a busion polypeptide. The recombinant nucleic acid comprises a heterologous polynucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunit against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.
                                                                                                                                                       Gaps

```

microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. 38kD antigenic protein 888888

"The genome sequence of Schizosaccharomyces pombe.";
Nature 415:871-880(2002).
-!- FUNCTION: Forms a one-to-one complex with ArPase to inhibit the enzyme activity completally (By similarity).
-!- SUMCELULAR LOCATION: Mitochondrial (By similarity).
-!- SIMILARITY: Belongs to the ArPase inhibitor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEQUENCE FROM N.A.

"Cloning of cat homolog of prostaglandin D synthase.";
"Cloning of cat homolog of prostaglandin D synthase.";
Submitted (DEC-1995) to the EMBL/GenBank/DDED databases.
-!- FUNCTION: Catalyzes the conversion of PGHZ to PGD2, a prostaglandin involved in smooth muscle contraction/relaxation and a potent inhibitor of platelet aggregation. Involved in a variety of CNS functions, such as sedation, NREM sleep and PGE2-induced allodynia, and may have an anti-apoptotic role in oligodendrocytes. Binds small non-substrate lipophilic molecules,

"Hydroquinone:O-glucosyltransferase from cultivated Rauvolfia cells:

"The mirichment and partial amino acid sequences.";

Phytochemistry 53:187-193(2000).

"I - FUNCTION: Broad spectrum multifunctional glucosyltransferase. In addition to hydroquinone it accept at least 45 natural and synthetic phenols as well as two cinnamyl alcohols as substrates.

"Hydroquinone was however the best substrate. In contrast to this broad acceptor substrate specificity, only pyrimidine nucleotide activated glucose is tolerated as a donor substrate.

"I- CATALYTIC ACTIVITY: UDP-glucose + hydroquinone = UDP + hydroquinone-O-beta-D-glucopyranoside.

"SIMILARITY: Belongs to the UDP-glycosyltransferase family.
                                                         Rauvolfia serpentina (Serpentwood) (Devilpepper).

"Massive gene decay in the leprosy bacillus.";
Nature 409:1007-1011(2001).
--- CATALYTIC ACTIVITY: Orotidine 5'-phosphate = UMP + CO(2).
--- PATHMAX: Pyrimidine blosynthesis; sixth (last) step.
--- SIMILARITY: Belongs to the OMP decarboxylase family. Subfamily 2.

-i- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

-i- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

IT BINDS TO THE E2RE RESPONSE ELEMENT (5'-ACCNNINDINGGT-3') PRESENT IN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN EITHER ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION WITH REGARDS TO PROMOTER ELEMENTS. REPRESSION OCCURS BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE=91135017; PubMed=1847266;
